

# Kaba-Saflok introduces the next era of online communication with Messenger® ZigBee.

**The ZigBee protocol is an internationally recognized and accepted wireless standard.**

When combined with SAFLOK's Messenger wireless online system, this standard enables smart room interoperability with other in-room devices.

With the advent of the ZigBee platform, entering a guestroom becomes a custom experience, tailored to the unique preferences of each guest. When a guest presents a keycard or other credential to a lock, devices on the ZigBee network spring into action.

For example, the lights adjust to the appropriate level, the television turns on with the appropriate channel and volume level, the powered blinds open or close, and the temperature adjusts - all to the guest's liking.
